WHERE IS THE MONEY?

**A Time-Series Analysis on Agricultural Commodity Market
Volumes and Prices in Kenya (Q3/2021 - Q2/2024)**

Part III: Meat Commodities

INTRO

Hello! My name is Edward Njiru, and I have been a dairy and fodder farmer in Kenya for the last four years.

Like several farmers, the decision to diversify is not an easy one. There is so much to consider regarding demand and profit margins.

So I took a deep-dive into the data.

Part III: ***Meat Commodities***

DATA

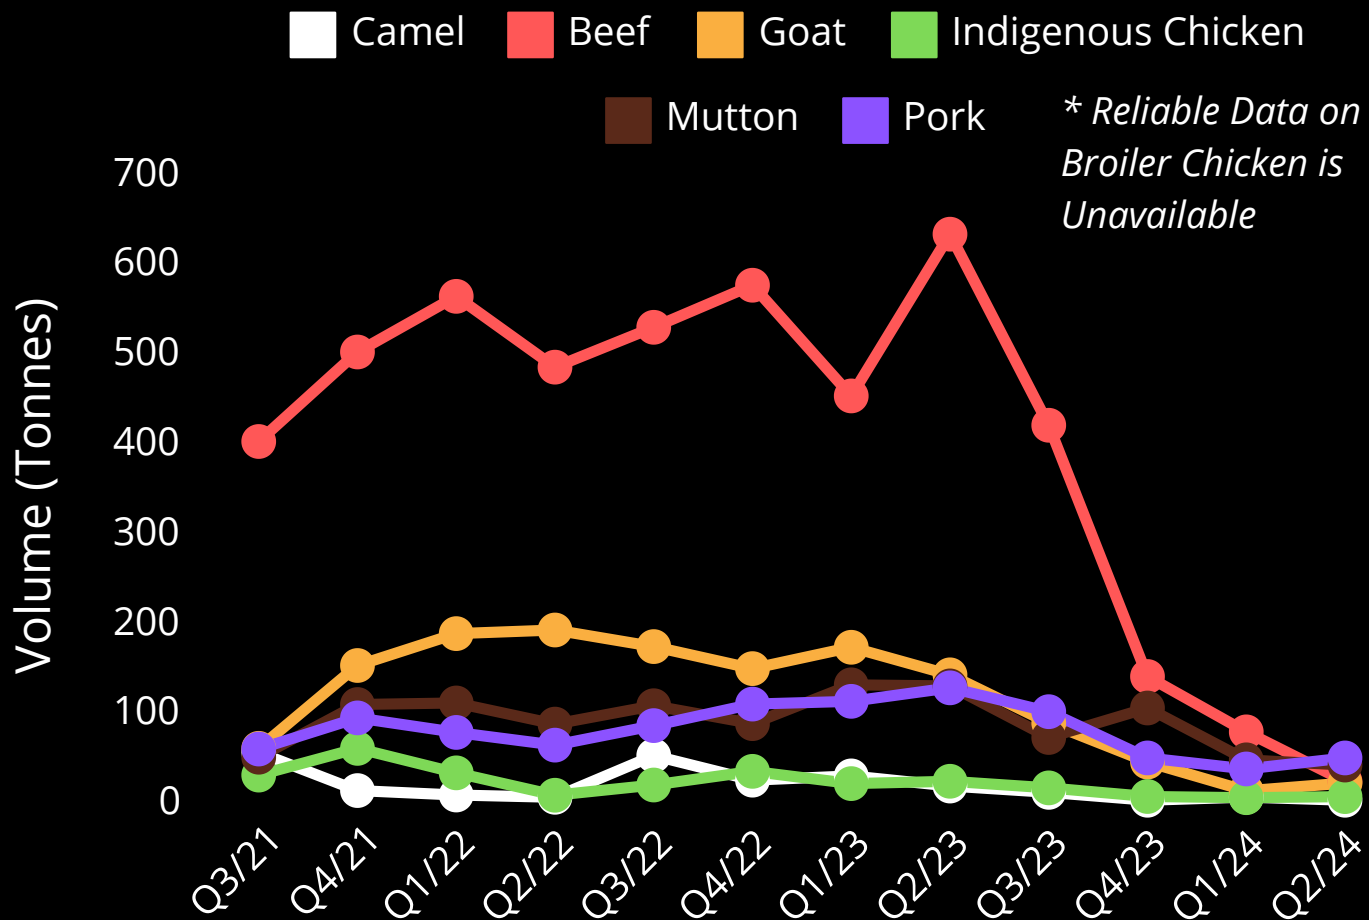

The data was sourced from the Kenya Agricultural Market Information System (KAMIS). The Objective Questions:

- Which commodities are in demand?
- What are the trends smallholder farmers, market linkage players and retailers should take note of?

TOP MEAT COMMODITIES

SALES VOLUME IN TONNES

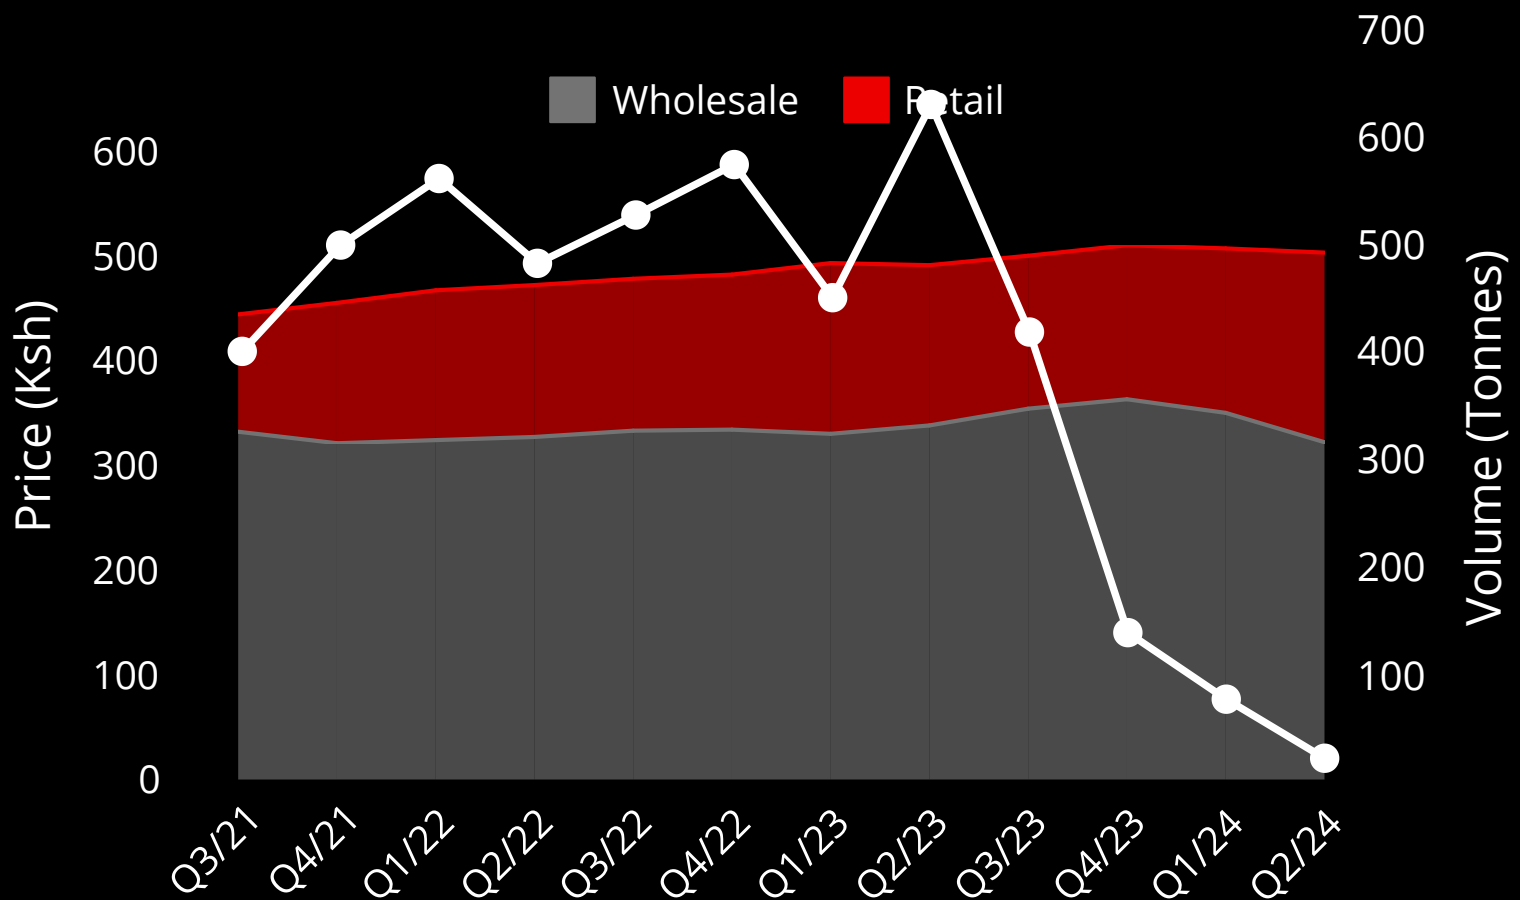

Despite a long-term dominance in the market, beef has drastically declined by almost 500 tonnes, with the rest gradually declining by an average of 87.8 tonnes.

TOP MEAT COMMODITIES

BEEF SALES VOLUMES & RESELL MARGINS

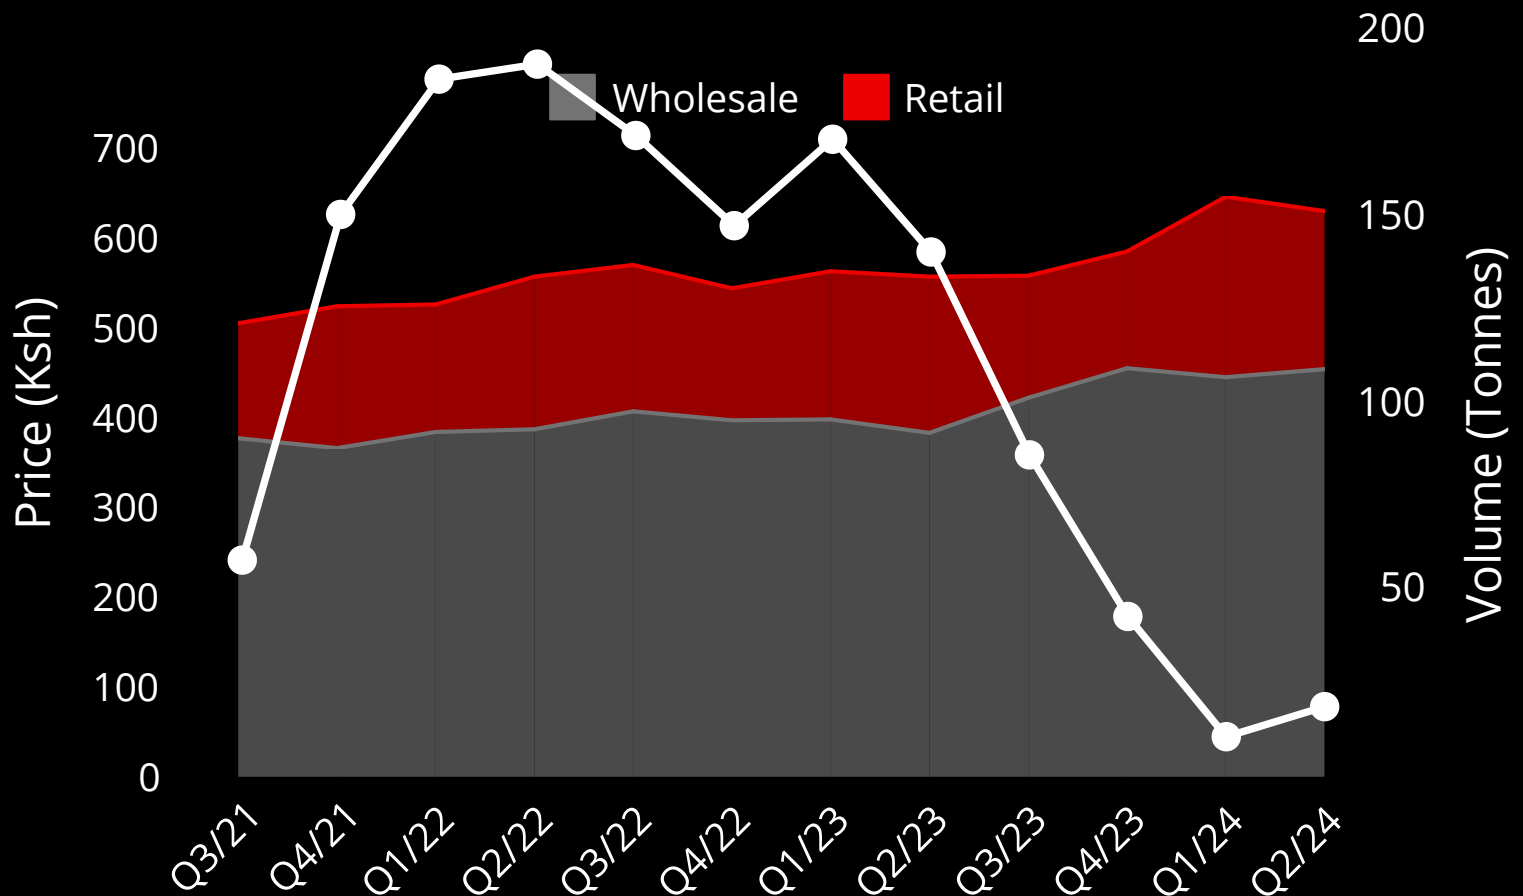

Beef prices have been fairly stable, but consumption has dipped drastically by **96.7%** over the past year.

This indicates that the challenge is more about the spending culture rather than an increase in beef prices.

TOP MEAT COMMODITIES

GOAT MEAT SALES VOLUMES & RESELL MARGINS

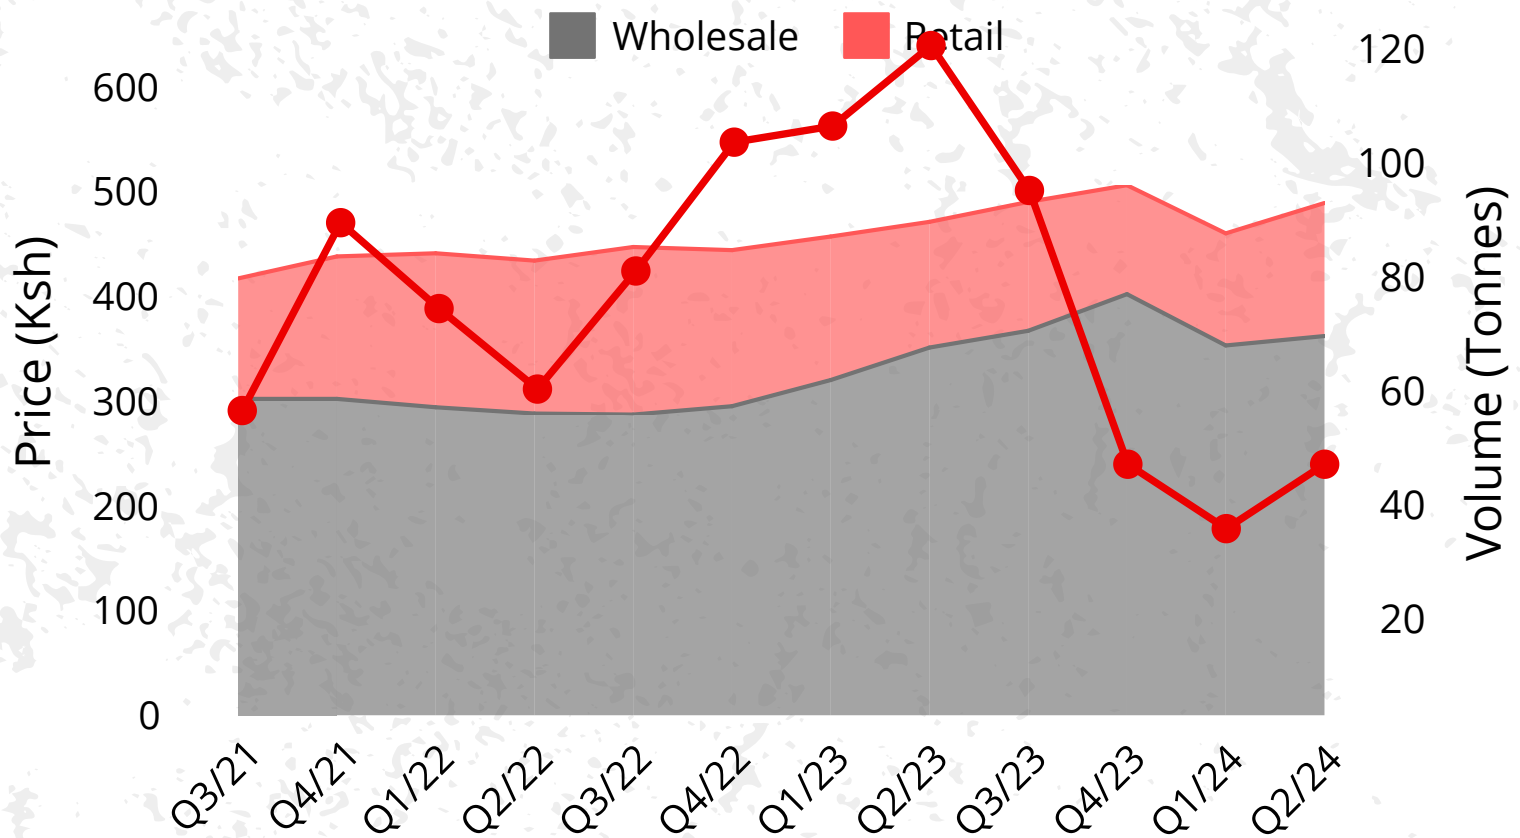

Goat meat consumption declines when prices peak, with a **93.5%** dip in 2023, indicating a significant relationship between price and consumption.

This shows that goat meat may not be a very stable commodity choice for farmers and retailers.

TOP MEAT COMMODITIES

PORK SALES VOLUMES & RESELL MARGINS

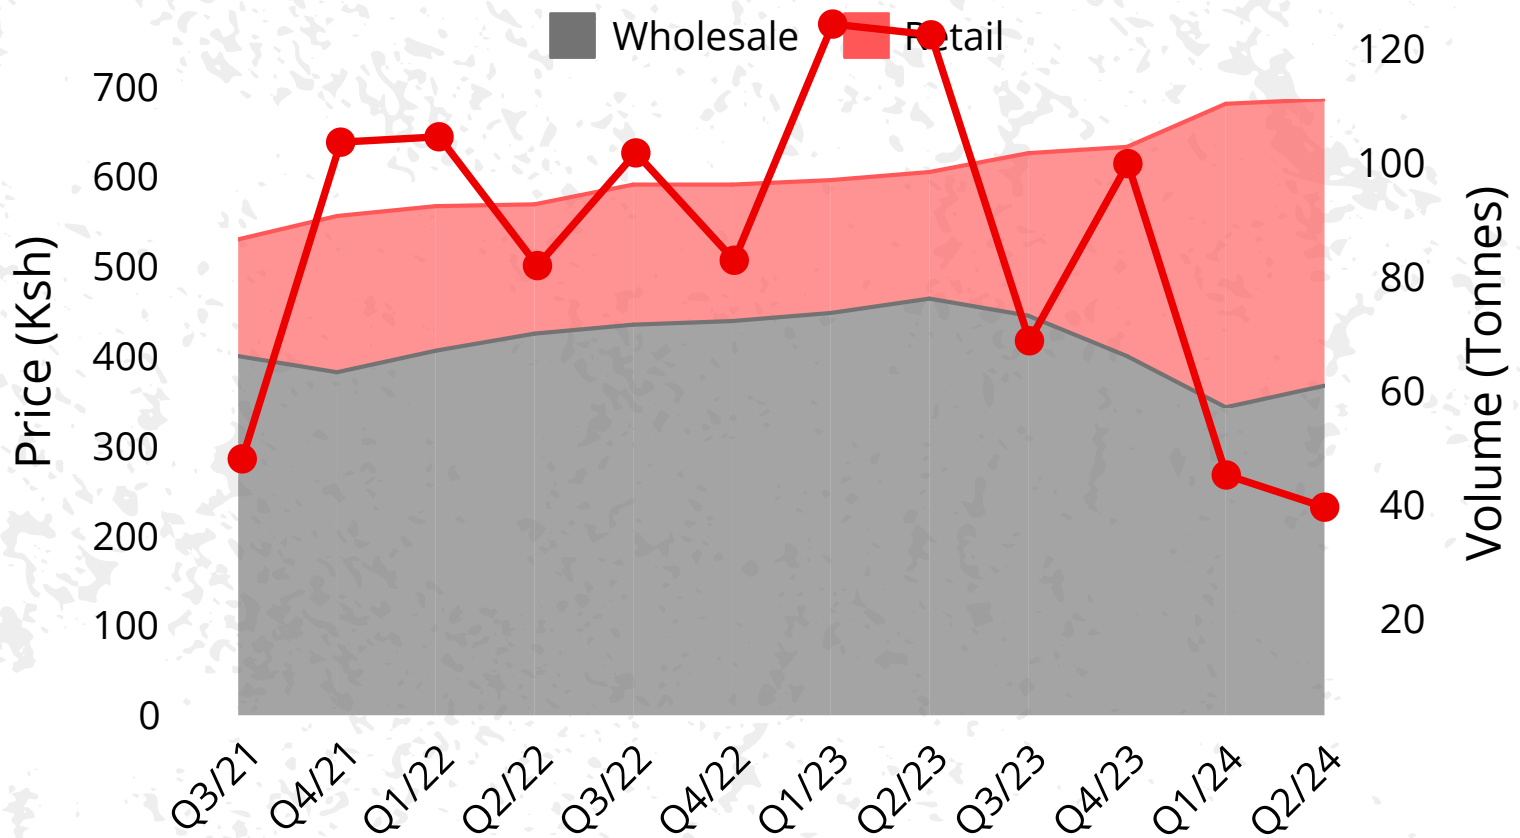

Pork consumption is quite erratic, with prices following demand. The margins are getting slimmer, with margins gradually decreasing by an average of **10.7%**, showing wholesale prices are exhibiting more control on market prices.

This indicates pork sources have good market-linkages, and resellers will have less control over their potential margins.

TOP MEAT COMMODITIES

MUTTON SALES VOLUMES & RESELL MARGINS

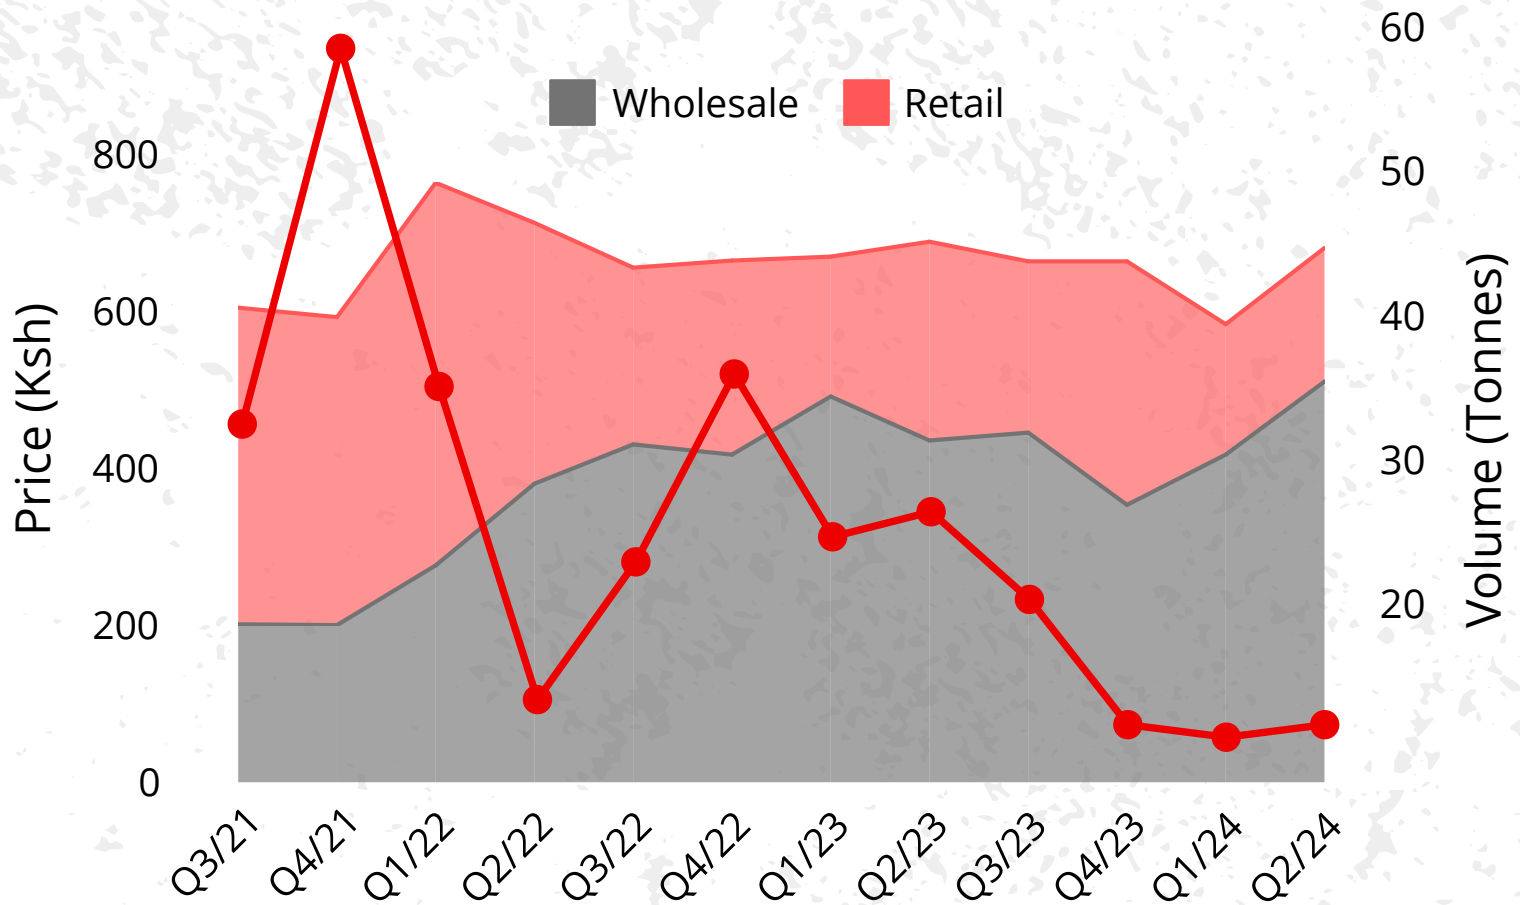

Mutton margins have been steadily increasing at an average of **34%** from Q2/22, showing great promise for retailers and brokers.

However, reduced consumption has impacted farm-gate prices, with the farmer bearing the loss despite retailers' and brokers' increased margins. This commodity is not an ideal choice for farmers and producers.

TOP MEAT COMMODITIES

INDIGENOUS CHICKEN SALES VOLUMES & RESELL MARGINS

Indigenous chicken consumption typically peaks during the Christmas festivities, with the exception of 2023.

A consistent reduction of an average **25.8%** in margins since 2021 indicates that market-linkages between producers and consumers are getting stronger by the day. This commodity can be an excellent choice for farmers, but not quite so for retailers and brokers.

INSIGHTS AND RECOMMENDATIONS

MEAT COMMODITIES

Commodities that have strong market linkages (producer-consumer) are experiencing a resurgence in consumption volumes. Digital linkage solutions and cold-chain support would greatly improve the performance of such commodities.

2023 appears to have been a difficult year in the market. But the typical festive season (Q4) has good consumption volumes across board, so farmers ought to structure their breeding and slaughter accordingly.

Since Q4/23, consumption volumes across different meat choices fairly similar, which indicates the typical consumer enjoys a variety, rather than sticking to a specific preference. Farmers ought to diversify their offerings in order to serve similar customers multiple times.

CONCLUSION

Hello again! I'm glad you read through this summary on Meat Commodities in Kenya in the last 3 years.

My next summary will be a deep-dive on Part IV: Milk, Eggs and Honey.

To catch-up on previous summaries:

[Part I: Seasonal Crops Summary](#)

[Part II: Perennial Crops Summary](#)

Stay tuned...
